

Timing Properties

Action Timing Settings

This property dialog allows you to edit properties relating to an action's timeout, pause interval and retry settings. This dialog appears when you click the ellipsis (...) edit button on the [Runtime property page](#).

The screenshot shows a dark-themed dialog box titled "Action Timing Settings". It is divided into three sections: "Pause", "Retries", and "Timeout".

- Pause:** Features a clock icon and a text field labeled "Pause after run :". The value is set to 0 ms.
- Retries:** Features a blue circular arrow icon. It contains two text fields: "Retry attempts : 0" and "Retry pause : 1000 ms".
- Timeout:** Features a clock icon with a red 'X' and a text field labeled "Enable timeout". The checkbox is unchecked, and the value is set to 1 minute.

At the bottom of the dialog are three buttons: "OK", "Cancel", and "Help".

Pause after Run

After the action completes, the build will pause for the specified period of time after this action completes before continuing on to the next action.

Retry Attempts

If the action fails, it will be retried this many times before failing outright.

Set the Retry Pause to delay between each retry. Setting Retry on "Try" actions allows you to retry an entire group of actions as one. See the [Try action topic](#) for more details.

Enable Timeout

If this properties is enabled and the action runs for longer than the specified number of minutes, it will be aborted and will fail. This property is not available for all actions.
