

Project Edit Password

Note that this feature is available in only the FinalBuilder Professional Edition.

The Edit Password for a project allows the owner of the project to set a password which is required to view and edit the steps of the build in design mode. When you open a project is opened that has an edit password, it will open on the Build Summary screen - clicking the Design tab will prompt for the password. The project can be run without the password.

To set an edit password, choose "Set Edit Password" from the Project menu:

This will bring up the Project Edit Password dialog. Type in the password required to edit the project. To set no password for the project, simply leave the new password fields blank.

Set Project Password [X]

☒ Create new password
☐ Change existing password
☐ Remove existing password

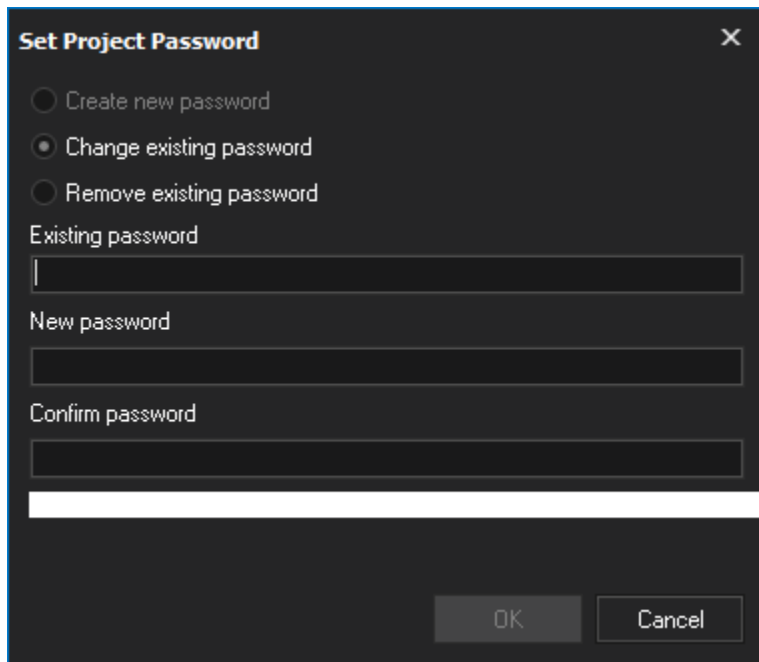

Existing password
[Text Input Field]

New password
[Text Input Field]

Confirm password
[Text Input Field]

[OK] [Cancel]

Now that the project password is set, if you click on the Design tab you get the following prompt:

The image shows a 'Set Project Password' dialog box with a dark background and a blue border. It has a title bar with the text 'Set Project Password' and a close button (X) in the top right corner. Inside the dialog, there are three radio buttons: 'Create new password', 'Change existing password' (which is selected), and 'Remove existing password'. Below these are three text input fields labeled 'Existing password', 'New password', and 'Confirm password'. The 'Existing password' field is empty. The 'New password' and 'Confirm password' fields are also empty. At the bottom of the dialog, there are two buttons: 'OK' and 'Cancel'.

One of the limitations with project edit passwords is that the project file must be saved as a compressed project file (.fbz7) - as this prevents the encrypted password in the project file being removed easily.
