

# WGet Download Action

The WGet Download action enables you to retrieve files using HTTP, HTTPS or FTP from a remote server.

The location of the WGet executable can be specified in the Tools - Options - Internet - WGet Options

## WGet Options

The image shows a screenshot of the 'WGet Download' dialog box. It has a title bar with a close button (X) and a tab bar with three tabs: 'General', 'Runtime', and 'WGet Options' (which is selected). The dialog is divided into two main sections: 'Local options' and 'Remote options'. The 'Local options' section includes 'Output directory' and 'Output filename' fields, each with a folder icon button. The 'Remote options' section includes a 'URL' field with a folder icon button, 'Username' and 'Password' fields, and three checkboxes: 'Recursive download', 'Update links', and 'Include page requisites'. Below these is a 'Depth' field with the value '5'. At the bottom right are 'OK', 'Cancel', and 'Help' buttons.

5

OK Cancel Help

### Local options

#### Output Directory

The base location that WGet will use when downloading files.

#### Output Filename

The Filename that the file will be saved to. If a full path is provided the Output Directory value will be ignored.

### Remote options

#### URL

The remote file to download

#### Username & Password

The authentication information to send to the remote server.

## **Recursive Download**

Use this option to traverse parts of the Web (or a single http or ftp server), following links and directory structure.

## **Update Links**

After the download is complete, convert the links in the document to make them suitable for local viewing.

## **Include Page Requisites**

With this option enabled, WGet will download all the files that are necessary to properly display a given html page. This includes such things as images, sounds, and referenced style sheet.

## **Depth**

The maximum depth to which the retrieval may descend into a remote site.

### Scripting Info

The Action properties available are :

property URL: String;

property OutputDirectory: String;

property OutputFilename: String;

property Username: String;

property Password: String;

property Recursive: Boolean;

property RecursiveDepth: String;

property UpdateLinks: Boolean;

property IncludePageRequisites: Boolean;
