

NuGet Install Action

The Install action downloads and installs the package from either the default or specified feed. You can use this action to ensure your automated build is using the most recent, or a specific, version of a library.

The image shows a 'NuGet Install' dialog box with a dark theme. It has three tabs: 'General', 'Runtime', and 'NuGet Install', with the last one being active. Under 'NuGet install options', there are two text fields: 'Package id/config' containing 'jquery' and 'Output directory' containing 'C:\Projects\Lib\jQuery'. Below this is the 'Optional parameters' section with a 'Source' field, a 'Version' field containing '1.6.1', and an unchecked checkbox labeled 'Exclude version from folder name'. At the bottom right are 'OK', 'Cancel', and 'Help' buttons.

On this page:

NuGet Install Options

Package Id/config

The id of the package to install, or the path to the a packages.config file.

Output Directory

The directory to place to downloaded package

Optional Parameters

Source

You can use this field to specify a different source feed. For example, your company may host its own internal NuGet package feed for sharing internal components. If left blank the package will be installed from the default package gallery, which you can view at <http://nuget.org/List/Packages>.

Version

You can use this field to specify a version of the package. If left blank the latest version will be installed.

Exclude version from folder name

By default, the package will be downloaded into a folder which is named [packageid][version]. Selecting this option causes the folder to be named [packageid].
