

# NuGet Spec Action

The Spec action creates a nuspec for a package. The nuspec is later used by the Pack action to create the NuGet package.

Help

On this page:

## NuGet Spec Options

### Package Name or Project File

You can specify either a project name or a project file. A project name will cause a new blank spec to be created. If you specify a Project File the nuspec will be based on the project metadata.

### Output Directory

The directory where the nuspec file should be created.

## Optional Parameters

### Assembly

You can optionally specify an assembly from which to get metadata.

### Force

This will overwrite the nuspec file if it already exists.
