

Stack or Queue Peek Item Action

[FinalBuilder Professional Edition]

The Stack/Queue Peek Item action is used to retrieve the next item from the list and set a variable to the value without removing the item from the list.

Peek

The screenshot shows the 'Stack/Queue Peek' dialog box. It has a title bar with a close button. Below the title bar are three tabs: 'General', 'Runtime', and 'Peek'. The 'Peek' tab is active. The dialog contains two main sections. The first section is labeled 'Stack/Queue name' and has a dropdown menu with 'OurStack' selected. The second section is labeled 'Peek to variable' and has a dropdown menu with 'L_File' selected. Below these is an unchecked checkbox labeled 'Expand variables'. At the bottom of the dialog are three buttons: 'OK', 'Cancel', and 'Help'.

Stack/Queue name

Select the name of the list which you want to peek. If there aren't any items in this list, you need to use the [Stack or Queue Define Action](#) action to create a new list.

Peek to Variable

Select a Variable to set to the peeked value. The item will not be removed from the list.

Expand variables

This will expand any variables in the item after it has been retrieved.

If there are no more items to peek, then the action will fail.
