

CSV Field Iterator Action

The CSV Field Iterator action allows you to easily iterate through the rows of any file where each line is a list of character-delimited fields (ie CSV comma-delimited files, tab-delimited files, etc.)

As each row in the file is iterated, field variables are set to the value of each field in that row.

For more information about iterator actions, see the [XML Iterator](#) actions.

Source File

The screenshot shows the 'CSV Field Iterator' dialog box with the 'Source File' tab selected. The 'Source file' section has a text box containing 'C:\Projects\SimpleProject\Src\Commands.txt' and a folder icon. The 'Field delimiter' section has a text box with a comma character and the text 'separates each field'. The 'Field variables' section has a text box containing 'L_File' and 'L_Command', with 'Up', 'Down', and 'Remove' buttons to its right. At the bottom right of the 'Field variables' section is an 'Add' button with a folder icon. At the bottom of the dialog are 'OK', 'Cancel', and 'Help' buttons.

Source File

Specify a file to iterate over.

Field Delimiter

By default, the iterator works with CSV (comma-delimited) files. However, you can use any delimiter character, or even a group of characters, to separate fields.

To use a "tab" character as the delimiter, specify \t.

Field Variables

This is where you specify the list of variables which are set on each iteration. The variables are set in order - ie the first variable is set to the field field, the second variable to the second field, etc, etc.

To add a new variable, select it from the combo box below the list and then click the "Add" button.

To move a variable up or down in the list, select it and then click the Up or Down button. To remove a variable, select it and click Remove.

At runtime, if there are more field variables to set than there are fields in a row, the extra variables will be cleared.

At runtime, if there are more fields in a row than there are field variables to set, the extra fields will be ignored.

Example

The example above shows the iterator set up for a file, Simple.csv, whose contents look like this:

John Smith, 33 Pine Way, 555-2357

Albert Jones, 12 North St, 555-1234

Walter Dennis, 66 Ridge Cr, 555-9842

The first time the iterator is run, the variable Name will have the value "John Smith". The second time the iterator runs, the variable Name will have the value "Albert Jones", etc.

The Address and Phone variables will be updated to reflect the Address and Phone fields for each row, as well.
