Replace Variables Action

The Replace Variables action replaces variable reference (ie %VariableName%) in a block of text with their current variable values.

Text can be loaded from a file or from another variable, and can be saved to either a file or a variable.

Replace Variables

Source Data

Source text can be loaded from a variable or from a file on disk.

Variable Replacement

Fail if any variables do not exist

If this option is set and a variable name is referenced but not defined, the action will fail. Otherwise, the variable reference will be deleted (ie replaced with an empty string.)

Write the replaced data to the log

Enable this option in order to echo the replaced text to the action's log output.

Destination Output

Write back to source

If selected, the source text (file or variable) will be overwritten with the new text. If this option is not selected then you can choose a file or variable to write with the new text.
