Windows Page File

The Windows Page File actions can retrieve various information about the current page file configuration and performance.

The available actions are:

There is some overlap with the capabilities of each of the actions - this is due to the objects retrieved via WMI queries.

All actions can either access the page file information on the local machine or on a network machine:

Local Machine

The action will connect to the local machine, with the credentials of the current user.

Remote Machine

The action will connect to a remote machine, using the specified user account.

Username

The username can be specified either by just the username or DOMAIN/username

Remote Host name

The computer which to connect to, if the remote computer is in a different domain then that of the current user account, a Fully Qualified Domain Name must be specified. An IPv4/IPv6 may also be specified.
