Windows Shares

The Windows Shares action enables the administration of shares, either on a local or remote machine.

? Unknown Attachment

Local Machine

The action will connect to the local machine, with the credentials of the current user.

Remote Machine

The action will connect to a remote machine, using the specified user account.

Username

The username can be specified either by just the username or DOMAIN/username

Remote Host name

The computer which to connect to, if the remote computer is in a different domain then that of the current user account, a Fully Qualified Domain Name must be specified. An IPv4/IPv6 may also be specified.
