

# Check If File or Folder Exists Action

This action allows you to check for the existence of a specific file or folder.

You can choose to fail the action if the file or folder exists, or if the file or folder is missing, or not to fail at all. You can also choose a variable to set. Its value will be set to "True" if the file or folder exists, or "False" otherwise.

When using the Do not fail option, you should specify a variable to hold the result of the file check.

On this page:

## Details

The screenshot shows the 'If File/Folder Exists' dialog box with the 'Details' tab selected. The dialog has three tabs: 'General', 'Runtime', and 'Details'. The 'Options' section has a green checkmark icon and two radio buttons: 'File spec or folder name' (selected) and 'FileSet'. The text field for 'File spec or folder name' contains 'C:\Projects\SimpleProject\Output\'. The 'Fail action if' section has a red 'X' icon and three radio buttons: 'File or folder is missing' (selected), 'File or folder exists', and 'Do not fail'. The 'Set variable' section has a blue pencil icon and a text field containing 'L\_Exists'. The dialog has 'OK', 'Cancel', and 'Help' buttons at the bottom.

**If File/Folder Exists**

General Runtime **Details**

**Options**

☒ File spec or folder name  
C:\Projects\SimpleProject\Output\

☐ FileSet

**Fail action if**

☒ File or folder is missing  
☐ File or folder exists  
☐ Do not fail

**Set variable**

The variable will be set to true if the node is found, false otherwise

L\_Exists

OK Cancel Help

## Options

### File spec or folder name

Specify the file spec, or folder name to test.

### Fileset

Specify the group of files/folders to check through the use of a FileSet.

### Fail action if

## File or folder is missing

Specify this option to check if the file/folder is missing. If the file/folder is missing, the action will fail.

## File or folder exists

Specify this option to check if the file/folder exists. If the file/folder exists, the action will fail.

## Do not fail

Specify this option to make the action no longer fail. This is useful when setting a variable with the result of the file/folder existence.

## Set variable

Specify the variable to set with the result of whether the file exists or not. If the variable is not specified then testing for previous action failure is the only other way to perform action conditional on the files existence.

## Examples

### File must be present

1. A critical file must be present:
2. Specify the name of the file.
3. On the Details tab, choose Fail Action If - File or Folder is Missing.
4. Do not specify a variable.

The build will immediately abort if the required file is missing.

### Warn user folder contains files

The user should be warned if any files are present in a directory.

1. Specify a path and a file mask, such as c:\builds\Output\\*.\*
2. On the Details tab, choose Fail Action If - File or Folder is Missing.
3. On the Runtime tab, select Fail Action If - Do not fail.
4. Create a (nested) sub-node with the required warning behaviour.

The build will skip the sub-node if the file is not present, but will keep running.

### Presences of file

Complex logic involving the presence of a file:

1. Specify the name of the file.
2. Choose "Do not Fail"
3. Specify the name of a variable which will indicate the presence of the file.
4. In a later "If...Then" step, use the name of the variable.

"True" indicates that the file exists. "False" indicates that the file does not exist.
