

# FTP Send Command Action

The FTPS Send Command action allows you to send a custom command to the FTPS server.

## FTP Send Command

**FTPS Send Command**

General Runtime **FTPS Send Command**

**FTPS Connection**

DeployFTPS

☐ Reconnect if disconnected

**Send Command**

Command  
XPWD

Accepted Response Codes  
200

Seperate multiple codes with a comma

**Options**

Save output to variable  
L\_File

☐ Detailed FTPS logging

OK Cancel Help

### FTPS Connection

The name of the FTPS connection to be used for the operation.

### Reconnect if disconnected

If the connection has become disconnected, attempt to re-connect and then execute the action.

### Send command

#### Command

This is the command to be sent to the FTPS Server.

#### Accepted Response Codes

When sending a command, at least one accepted response code must be provided. If the code returned by the server is not in the list of accepted responses then the action will fail.

Accepted response codes must be an numeric value. Multiple response codes can be passed be separating each response code with a comma.

Using the detailed logging option will help you determine the accepted response code that you will need to use for this action. The accepted response code will vary depending on the command being sent.

## Options

### Save output to variable

Specify the name of a variable to save the output of a command to.

### Detailed FTPS logging

Enable this option to log the messages that are sent between the client and the server. This may be useful when attempting to troubleshoot problems.
