

# Project Edit Password

The Edit Password for a project allows the owner of the project to set a password which is required to view and edit the steps of the build in design mode. When you open a project is opened that has an edit password, it will open on the Build Summary screen - clicking the Design tab will prompt for the password. The project can be run without the password.

To set an edit password, choose "Set Edit Password" from the Project menu:

This will bring up the Project Edit Password dialog. Type in the password required to edit the project. To set no password for the project, simply leave the new password fields blank.

A screenshot of the 'Set Project Password' dialog box. The dialog has a title bar with a close button (X). It contains three radio buttons: 'Create new password' (selected), 'Change existing password', and 'Remove existing password'. Below these are three text input fields: 'Existing password', 'New password', and 'Confirm password'. The 'New password' field is currently empty and has a red border. At the bottom of the dialog are 'OK' and 'Cancel' buttons.

Now that the project password is set, if you click on the Design tab you get the following prompt:

Set Project Password

×

☐ Create new password

☒ Change existing password

☐ Remove existing password

Existing password

New password

Confirm password

OK

Cancel

One of the limitations with project edit passwords is that the project file must be saved as a compressed project file (.fbz7) - as this prevents the encrypted password in the project file being removed easily.
