

Boolean Object

The Boolean object represents a true or false value and includes Boolean functions to transform and compare, and a function to convert to a string type.

Name and Parameters	Description	Return Type	Usage Examples	
And (boolean value)	Returns logical AND of current boolean value with specified value	Boolean	\$Build.IsFeatureBranchBuild.And(%Deploy%)\$	False
Or (boolean value)	Returns logical OR of current boolean value with specified value	Boolean	\$Build.IsFeatureBranchBuild.Or(%Deploy%)\$	True
Not ()	Negates current boolean value	Boolean	\$Build.IsFeatureBranchBuild.Not()\$ \$Build.IsFeatureBranchBuild.And(%Deploy%).Not()\$ \$Build.IsFeatureBranchBuild.Not().And(%Deploy%)\$	True True True
ToString ()	Parses current boolean to a string, allowing string operations and functions	String	\$Build.IsFeatureBranchBuild.ToString().ToLower()\$	"false"
