

Version Object

The version object **Version** is used by the version property of the [Build](#) object. It provides access to each component the version string

Properties

Name	Description	Type	Usage Example
Default	A reference object for decomposing a version string using the default versioning format	DotNet	\$Build.Version.Default
DotNet	A reference object for decomposing a version string using the .Net versioning format	DotNet	\$Build.Version.DotNet
Semantic	A reference object for decomposing a version string using the Semantic versioning format	Semantic	\$Build.Version.Semantic

DotNet Properties

Name	Description	Type	Usage Example (given "1.2.3.4")	
Build	The build component of the version number	Integer	\$Build.Version.Default.Build\$	3
Major	The major component of the version number	Integer	\$Build.Version.Default.Major\$	1
Minor	The minor component of the version number	Integer	\$Build.Version.Default.Minor\$	2
Revision	The revision component of the version number	Integer	\$Build.Version.Default.Revision\$	4

Semantic Properties

Name	Description	Type	Usage Example (given "1.2.1287-beta+meta")	
IsPrerelease	True if pre-release labels exist for the version	Boolean	\$Build.Version.Semantic.IsPrerelease\$	True
HasMetaData	True if metadata exists for the version	Boolean	\$Build.Version.Semantic.IsPrerelease\$	True
Major	The major component of the version number.	Integer	\$Build.Version.Semantic.Major\$	1
MetaData	The metadata string after the plus at the end of the version number	String	\$Build.Version.Semantic.MetaData\$	"meta"
Minor	The minor component of the version number	Integer	\$Build.Version.Semantic.Minor\$	2
Patch	The patch component of the version number	Integer	\$Build.Version.Semantic.Revision\$	1287
Release	The full pre-release label for the version	String	\$Build.Version.Semantic.Revision\$	"beta"
