Stage Object

The stage object **$Stage** provides access to the properties of the current stage. This is also used as a child object of the Stages Collection under the Build Object e.g. $Build.Stages.First().Name$

Name	Description	Type	Usage Example	
AgentName	The host name of the agent that the current stage is running on.	String	$Stage.AgentName$	"ciagent01"
Elapsed	The time period since the current stage was started.	TimeSpan	$Stage.Elapsed$	"00:10:01.7587427"
Finished	The date/time when the current stage finished (if finished).	DateTime	$Stage.Finished$	"9/11/2018 10:44:54"
HasWarnings	True if the current stage has warnings	Boolean	$Stage.HasWarnings$	False
IsError	True if the current stage has errors	Boolean	$Stage.IsError$	False
IsFailure	True if the current stage has failures	Boolean	$Stage.IsFailure$	False
IsSpecial	True if the current stage is a special stage created to run pre- or post-stage events	Boolean	$Stage.IsSpecial$	False
IsSuccessful	True if the current stage is successful	Boolean	$Stage.IsSuccessful$	True
Metrics	The metrics associated with the current stage.	Metrics	$Stage.Metrics	See Metrics
Name	The name of the current stage as defined within the workflow editor.	String	$Stage.Name$	"Test Stage"
Order	The running order of the current stage.	Integer	$Stage.Order$	2
Started	The date/time when the current stage was started.	DateTime	$Stage.Started$	"9/11/2018 10:34:53"
