

Boolean Object

The Boolean object represents a true or false value and includes Boolean functions to transform and compare, and a function to convert to a string type.

Name and Parameters	Description	Return Type	Usage Examples	
And(boolean value)	Returns logical AND of current boolean value with specified value	Boolean	\$Build.IsTrueBranchBuild.And(%Deploy%)\$	False
Or(boolean value)	Returns logical OR of current boolean value with specified value	Boolean	\$Build.IsTrueBranchBuild.Or(%Deploy%)\$	True
Not()	Negates current boolean value	Boolean	\$Build.IsTrueBranchBuild.Not()\$ \$Build.IsTrueBranchBuild.And(%Deploy%).Not()\$ \$Build.IsTrueBranchBuild.Not().And(%Deploy%)\$	True True True
ToString()	Parses current boolean to a string, allowing string operations and functions	String	\$Build.IsTrueBranchBuild.ToString().ToLower()\$	"false"
